

Meccano triangles

<https://github.com/heptagons/meccano/nest>

Abstract

We construct meccano triangles. Basic triangles has the three sides as integers and calculate the internal diagonal distances. Such diagonals then are used as the new side of more complicated triangles and then again we calculate new distances formed and so on. Eventually we expect to find certain angles joining the triangles which can be used to construct regular polygons or more figures.

1 Triangles (a, b, c)

Triangles (a, b, c) have three sides a, b and c where $a, b, c \in \mathbb{N}$. To avoid repetitions and get only valid triangles, we consider only the cases:

$$a \geq b \geq c \quad (1)$$

$$a < b + c \quad (2)$$

The cosines of the three angles of triangle (a, b, c) are rationals $\cos A, \cos B, \cos C \in \mathbb{Q}$:

$$\cos \begin{pmatrix} A \\ B \\ C \end{pmatrix} = \begin{pmatrix} \frac{b^2 + c^2 - a^2}{2bc} \\ \frac{c^2 + a^2 - b^2}{2ca} \\ \frac{a^2 + b^2 - c^2}{2ab} \end{pmatrix} \equiv \begin{pmatrix} \frac{a_N}{a_D} \\ \frac{b_N}{b_D} \\ \frac{c_N}{c_D} \end{pmatrix} \in \mathbb{Q} \quad (3)$$

Where numerators are integers $a_N, b_N, c_N \in \mathbb{Z}$ and denominators are naturals $a_D, b_D, c_D \in \mathbb{N}$.

The sines of the three angles are algebraic $\sin A, \sin B, \sin C \in \mathbb{A}$:

$$\sin \begin{pmatrix} A \\ B \\ C \end{pmatrix} = \begin{pmatrix} \frac{\sqrt{1 - \cos^2 A}}{1} \\ \frac{\sqrt{1 - \cos^2 B}}{1} \\ \frac{\sqrt{1 - \cos^2 C}}{1} \end{pmatrix} = \begin{pmatrix} \frac{\sqrt{a_D^2 - a_N^2}}{a_D} \\ \frac{\sqrt{b_D^2 - b_N^2}}{b_D} \\ \frac{\sqrt{c_D^2 - c_N^2}}{c_D} \end{pmatrix} \equiv \begin{pmatrix} \frac{\sqrt{a_S}}{a_D} \\ \frac{\sqrt{b_S}}{b_D} \\ \frac{\sqrt{c_S}}{c_D} \end{pmatrix} \in \mathbb{A} \quad (4)$$

Data from github.com/heptagons/meccano/nest/t_test.go TestTCosSin

1.1 Triangle (a, b, c) diagonals

Within the triangle (a, b, c) we can form diagonals as lines joining integer points in sides with others sides integer points. To calculate the diagonals we use the law of cosines. With the $\cos A \equiv a_N/a_D$ we can calculate diagonals $\overline{b_m c_n}$:

$$\overline{b_m c_n} = \sqrt{m^2 + n^2 - 2mn \cos A} = \sqrt{m^2 + n^2 - 2mn \frac{a_N}{a_D}} \quad (5)$$

$$= \frac{\sqrt{a_D^2(m^2 + n^2) - 2a_D mn}}{a_D} \quad (6)$$

where $1 \leq m \leq b$, $1 \leq n \leq c$ and $m - n \geq 0$. Totally we have:

$$\begin{pmatrix} \overline{b_m c_n} \\ \overline{a_m c_n} \\ \overline{a_m b_n} \end{pmatrix} = \begin{pmatrix} \frac{\sqrt{a_D^2(m^2 + n^2) - 2a_D mn}}{a_D} \\ \frac{\sqrt{b_D^2(m^2 + n^2) - 2b_D mn}}{b_D} \\ \frac{\sqrt{c_D^2(m^2 + n^2) - 2c_D mn}}{c_D} \end{pmatrix} \in \mathbb{A} \quad (7)$$

1.2 Example triangle (7,6,5)

We calculate all the diagonals of triangle(7,6,5) with code at:

github.com/heptagons/meccano/nest/t_test.go TestT765diags.

Figure 1: Triangle (7,6,5) $b_m c_n$ diagonals ($m \geq n$).

Figure 1 show triangle (7,6,5) diagonals $b_m c_n$ for vertex A. The diagonals values are set in a first matrix with columns b_1, \dots, b_6 and rows c_1, \dots, c_5 . Empty cells are repetitions.

$$b_{1:6}c_{1:5} = \begin{pmatrix} \frac{2\sqrt{10}}{5} & \frac{\sqrt{105}}{5} & \frac{2\sqrt{55}}{5} & \frac{\sqrt{385}}{5} & 2\sqrt{6} & \frac{\sqrt{865}}{5} \\ & \frac{4\sqrt{10}}{5} & \frac{\sqrt{265}}{5} & \frac{2\sqrt{105}}{5} & 5 & \frac{4\sqrt{55}}{5} \\ & & \frac{6\sqrt{10}}{5} & \frac{\sqrt{505}}{5} & 2\sqrt{7} & \frac{3\sqrt{105}}{5} \\ & & & \frac{8\sqrt{10}}{5} & \sqrt{33} & \frac{2\sqrt{265}}{5} \\ & & & & 2\sqrt{10} & \end{pmatrix} \quad (8)$$

Figure 2 show triangle (7,6,5) diagonals $a_m c_n$ for vertex B. The diagonals are set in a second matrix with columns a_1, \dots, a_7 and rows c_1, \dots, c_5 . Empty cells are repetitions. Values at column 7 (at the right of separator |) are repeated and already accounted in previous matrix.

$$a_{1:7}c_{1:5} = \begin{pmatrix} \frac{4\sqrt{70}}{35} & \frac{3\sqrt{385}}{35} & \frac{2\sqrt{2065}}{35} & \frac{\sqrt{15505}}{35} & \frac{12\sqrt{7}}{7} & \frac{\sqrt{37345}}{35} & \frac{2\sqrt{265}}{5} \\ & \frac{8\sqrt{70}}{35} & \frac{\sqrt{7945}}{35} & \frac{6\sqrt{385}}{35} & \frac{\sqrt{889}}{7} & \frac{4\sqrt{2065}}{35} & \frac{3\sqrt{105}}{5} \\ & & \frac{12\sqrt{70}}{35} & \frac{\sqrt{14665}}{35} & \frac{2\sqrt{217}}{7} & \frac{9\sqrt{385}}{35} & \frac{4\sqrt{55}}{5} \\ & & & \frac{16\sqrt{70}}{35} & \frac{3\sqrt{105}}{7} & \frac{2\sqrt{7945}}{35} & \frac{\sqrt{865}}{5} \\ & & & & \frac{4\sqrt{70}}{7} & \frac{\sqrt{1393}}{7} & \end{pmatrix} \quad (9)$$

Figure 3 show triangle (7,6,5) diagonals $a_m b_n$ for vertex C. The diagonals are set in a third matrix with columns a_1, \dots, a_7 and rows b_1, \dots, b_6 . Empty cells are repetitions. Values at columns 6 and 7 (at the

Figure 2: Triangle (7, 6, 5), $a_m c_n$ diagonals ($m \geq n$).

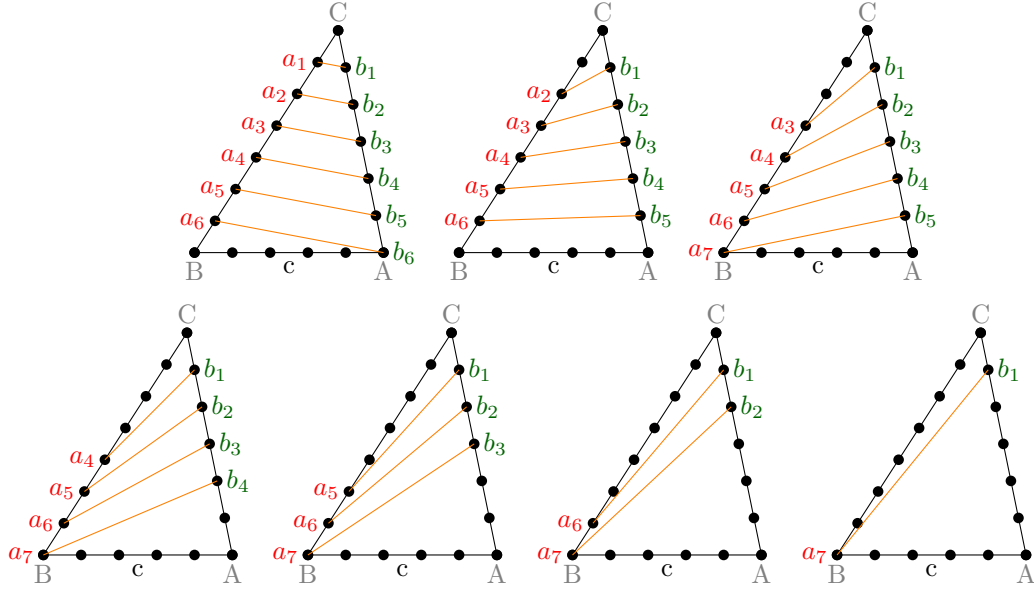

Figure 3: Triangle (7, 6, 5), $a_m b_n$ diagonals ($m \geq n$).

right of separator |) are repeated and already in previous matrices.

$$a_{1:7}b_{1:6} = \begin{pmatrix} \frac{2\sqrt{7}}{7} & \frac{\sqrt{105}}{7} & \frac{2\sqrt{70}}{7} & \frac{\sqrt{553}}{7} & \frac{2\sqrt{231}}{7} & \frac{\sqrt{1393}}{7} & 2\sqrt{10} \\ & \frac{4\sqrt{7}}{7} & \frac{\sqrt{217}}{7} & \frac{2\sqrt{105}}{7} & \frac{\sqrt{721}}{7} & \frac{4\sqrt{70}}{7} & \sqrt{33} \\ & & \frac{6\sqrt{7}}{7} & \frac{\sqrt{385}}{7} & \frac{2\sqrt{154}}{7} & \frac{3\sqrt{105}}{7} & 2\sqrt{7} \\ & & & \frac{8\sqrt{7}}{7} & \frac{\sqrt{609}}{7} & \frac{2\sqrt{217}}{7} & 5 \\ & & & & \frac{10\sqrt{7}}{7} & \frac{\sqrt{889}}{7} & 2\sqrt{6} \\ & & & & & \frac{12\sqrt{7}}{7} & \end{pmatrix} \quad (10)$$

2 Triangles($\sqrt{\alpha}, b, c$)

Triangles($\sqrt{\alpha}, b, c$) have three sides with lengths $a = \sqrt{\alpha}$, b and c where $\alpha, b, c \in \mathbb{N}$ and α is square-free. We have:

$$\sqrt{\alpha} > b \geq c \implies \alpha > b^2 \geq c^2 \quad (11)$$

$$\sqrt{\alpha} < b + c \implies \alpha < (b + c)^2 \quad (12)$$

We calculate the triangle cosines. $\cos A$ is rational and $\cos B$ and $\cos C$ are algebraic:

$$\cos A = \frac{b^2 + c^2 - (\sqrt{\alpha})^2}{2bc} = \frac{b^2 + c^2 - \alpha}{2bc} \in \mathbb{Q} \quad (13)$$

$$\cos B = \frac{(\sqrt{\alpha})^2 + c^2 - b^2}{2\sqrt{\alpha}c} = \frac{(\alpha + c^2 - b^2)\sqrt{\alpha}}{2\alpha c} \in \mathbb{A} \quad (14)$$

$$\cos C = \frac{(\sqrt{\alpha})^2 + b^2 - c^2}{2\sqrt{\alpha}b} = \frac{(\alpha + b^2 - c^2)\sqrt{\alpha}}{2\alpha b} \in \mathbb{A} \quad (15)$$

2.1 Triangle ($\sqrt{\alpha}, b, c$) diagonals

The only possible diagonals are for sides with integers, that is $\overline{b_m c_n}$. Using the law of cosines:

$$\overline{b_m c_n} = \sqrt{m^2 + n^2 - 2mn \cos A} \quad (16)$$

$$= \sqrt{m^2 + n^2 - 2mn \frac{b^2 + c^2 - \alpha}{2bc}} \quad (17)$$

$$= \frac{\sqrt{b^2 c^2 (m^2 + n^2) - b c m n (b^2 + c^2 - \alpha)}}{bc} \in \mathbb{A} \quad (18)$$

where $1 \leq m \leq b$, $1 \leq n \leq c$ and $m \geq n$.

2.2 Example triangles($2\sqrt{6}, b, c$)

In this case $\sqrt{\alpha} = 2\sqrt{6}$ so $\alpha = 24$. Then $m = n = \{1, 2, 3, 4\}$ because $b^2 = c^2 = \{1, 4, 9, 16\} < 24$. We form a matrix with the values $(b + c)^2$ and satisfying $b \geq c$:

$$(b_m + c_n)^2 = \begin{matrix} & b = 1 & b = 2 & b = 3 & b = 4 \\ \begin{matrix} c = 1 \\ c = 2 \\ c = 3 \\ c = 4 \end{matrix} & \begin{pmatrix} 2 & 9 & 16 & 25 \\ \times & 16 & 25 & 36 \\ \times & \times & 36 & 49 \\ \times & \times & \times & 64 \end{pmatrix} \end{matrix} \quad (19)$$

Then we remove the cells that don't satisfy the condition $\alpha < (b + c)^2$:

$$(b_m + c_n)^2 = \begin{matrix} & b = 1 & b = 2 & b = 3 & b = 4 \\ \begin{matrix} c = 1 \\ c = 2 \\ c = 3 \\ c = 4 \end{matrix} & \begin{pmatrix} \times & \times & \times & 25 \\ & \times & 25 & 36 \\ & & 36 & 49 \\ & & & 64 \end{pmatrix} \end{matrix} \quad (20)$$

Figure 4: All triangles with sides $a = 2\sqrt{6} > b \geq c$

Each remaining cell in the matrix corresponds to a particular triangle:

$$(2\sqrt{6}, b, c) = \begin{matrix} & \cos A & \cos B & \cos C \\ \begin{matrix} (2\sqrt{6}, 3, 2) \\ (2\sqrt{6}, 3, 3) \\ (2\sqrt{6}, 4, 1) \\ (2\sqrt{6}, 4, 2) \\ (2\sqrt{6}, 4, 3) \\ (2\sqrt{6}, 4, 4) \end{matrix} & \begin{pmatrix} -\frac{11}{12} & \frac{19\sqrt{6}}{48} & \frac{29\sqrt{6}}{72} \\ -\frac{1}{3} & \frac{\sqrt{6}}{3} & \frac{\sqrt{6}}{3} \\ -\frac{7}{8} & \frac{3\sqrt{6}}{8} & \frac{13\sqrt{6}}{32} \\ -\frac{1}{4} & \frac{\sqrt{6}}{4} & \frac{3\sqrt{6}}{8} \\ \frac{1}{24} & \frac{17\sqrt{6}}{72} & \frac{31\sqrt{6}}{96} \\ \frac{1}{4} & \frac{\sqrt{6}}{4} & \frac{\sqrt{6}}{4} \end{pmatrix} \end{matrix} \quad (21)$$

Figure 4 show the triangles $(2\sqrt{6}, b, c)$. The cosines are calculated by code at:

github.com/heptagons/meccano/nest/t_test.go TestTslursA

3 Triangles($a, \sqrt{\beta}, c$)

Triangles($a, \sqrt{\beta}, c$) have the three sides $a, b = \sqrt{\beta}$ and c where $a, \beta, c \in \mathbb{N}$ and β is squarefree. We have:

$$a > \sqrt{\beta} > c \implies a^2 > \beta > c^2 \quad (22)$$

$$a < \sqrt{\beta} + c \implies (a - c)^2 < \beta \quad (23)$$

We calculate the triangle cosines. $\cos A$ is algebraic, $\cos B$ rational and $\cos C$ algebraic:

$$\cos A = \frac{(\sqrt{\beta})^2 + c^2 - a^2}{2\sqrt{\beta}c} = \frac{(\beta + c^2 - a^2)\sqrt{\beta}}{2\beta c} \in \mathbb{A} \quad (24)$$

$$\cos B = \frac{a^2 + c^2 - (\sqrt{\beta})^2}{2ac} = \frac{a^2 + c^2 - \beta}{2ac} \in \mathbb{Q} \quad (25)$$

$$\cos C = \frac{a^2 + (\sqrt{\beta})^2 - c^2}{2a\sqrt{\beta}} = \frac{(a^2 + \beta - c^2)\sqrt{\beta}}{2a\beta} \in \mathbb{A} \quad (26)$$

3.1 Triangle $(a, \sqrt{\beta}, c)$ diagonals

The only possible diagonals are for sides with integers, that is $\overline{a_m c_n}$. Using the law of cosines:

$$\overline{a_m c_n} = \sqrt{m^2 + n^2 - 2mn \cos B} \quad (27)$$

$$= \sqrt{m^2 + n^2 - 2mn \frac{a^2 + c^2 - \beta}{2ac}} \quad (28)$$

$$= \frac{\sqrt{a^2 c^2 (m^2 + n^2) - acmn(a^2 + c^2 - \beta)}}{ac} \in \mathbb{A} \quad (29)$$

where $1 \leq m \leq a$, $1 \leq n \leq c$ and $m \geq n$.

3.2 Example triangles $(a, 2\sqrt{6}, c)$

In this case $\sqrt{\beta} = 2\sqrt{6}$ so $\beta = 24$. Then $m = \{5, 6, 7, \dots\}$ because $m^2 = \{25, 36, 49, \dots\} > 24$ and $n = \{1, 2, 3, 4\}$ because $c^2 = \{1, 4, 9, 16\} < 24$. We form a matrix with the values $(a - c)^2$:

$$(a_m - c_n)^2 = \begin{matrix} & a=5 & a=6 & a=7 & a=8 & a=9 & \dots \\ \begin{matrix} c=1 \\ c=2 \\ c=3 \\ c=4 \end{matrix} & \begin{pmatrix} 16 & 25 & 36 & 49 & 64 & \dots \\ 9 & 16 & 25 & 36 & 49 & \dots \\ 4 & 9 & 16 & 25 & 36 & \dots \\ 1 & 4 & 9 & 16 & 25 & \dots \end{pmatrix} \end{matrix} \quad (30)$$

We remove cells which don't satisfy the condition $(a - c)^2 < \beta$:

$$(a_m - c_n)^2 = \begin{matrix} & a=5 & a=6 & a=7 & a=8 & a=9 & \dots \\ \begin{matrix} c=1 \\ c=2 \\ c=3 \\ c=4 \end{matrix} & \begin{pmatrix} 16 & \times & \times & \times & \times & \dots \\ 9 & 16 & \times & \times & \times & \dots \\ 4 & 9 & 16 & \times & \times & \dots \\ 1 & 4 & 9 & 16 & \times & \dots \end{pmatrix} \end{matrix} \quad (31)$$

Figure 5: All triangles with sides $a > b = 2\sqrt{6} > c$

So we have ten triangles are valid:

$$(a, 2\sqrt{6}, c) = \begin{matrix} & \cos A & \cos B & \cos C \\ \begin{pmatrix} (5, 2\sqrt{6}, 1) \\ (5, 2\sqrt{6}, 2) \\ (5, 2\sqrt{6}, 3) \\ (5, 2\sqrt{6}, 4) \\ (6, 2\sqrt{6}, 2) \\ (6, 2\sqrt{6}, 3) \\ (6, 2\sqrt{6}, 4) \\ (7, 2\sqrt{6}, 3) \\ (7, 2\sqrt{6}, 4) \\ (8, 2\sqrt{6}, 4) \end{pmatrix} & \begin{pmatrix} 0 \\ \frac{\sqrt{6}}{16} \\ \frac{\sqrt{6}}{9} \\ \frac{5\sqrt{6}}{32} \\ \frac{\sqrt{6}}{6} \\ \frac{\sqrt{6}}{24} \\ \frac{\sqrt{6}}{24} \\ -\frac{2\sqrt{6}}{9} \\ -\frac{3\sqrt{6}}{32} \\ \frac{\sqrt{6}}{4} \end{pmatrix} & \begin{pmatrix} \frac{1}{5} \\ \frac{1}{4} \\ \frac{1}{3} \\ \frac{17}{40} \\ \frac{2}{3} \\ \frac{7}{12} \\ \frac{7}{12} \\ \frac{17}{21} \\ \frac{41}{56} \\ \frac{7}{8} \end{pmatrix} & \begin{pmatrix} \frac{2\sqrt{6}}{5} \\ \frac{3\sqrt{6}}{8} \\ \frac{\sqrt{6}}{3} \\ \frac{11\sqrt{6}}{40} \\ \frac{7\sqrt{6}}{18} \\ \frac{17\sqrt{6}}{48} \\ \frac{11\sqrt{6}}{36} \\ \frac{8\sqrt{6}}{21} \\ \frac{19\sqrt{6}}{56} \\ \frac{3\sqrt{6}}{8} \end{pmatrix} \end{matrix} \quad (32)$$

Figure 5 show the triangles $(a, 2\sqrt{6}, c)$. The cosines are calculated by code at:

github.com/heptagons/meccano/nest/t_test.go TestTslursB

4 Triangles($a, b, \sqrt{\gamma}$)

Triangles($a, b, \sqrt{\gamma}$) have three sides $a, b, \sqrt{\gamma}$ where $a, b, \gamma \in \mathbb{N}$ and γ is squarefree. We have:

$$a \geq b > \sqrt{\gamma} \implies a^2 \geq b^2 > \gamma \quad (33)$$

$$a < b + \sqrt{\gamma} \implies (a - b)^2 < \gamma \quad (34)$$

We calculate the triangle cosines. $\cos A$ and $\cos B$ are algebraic and $\cos C$ rational:

$$\cos A = \frac{b^2 + \gamma - a^2}{2b\sqrt{\gamma}} = \frac{(b^2 + \gamma - a^2)\sqrt{\gamma}}{2b\gamma} \in \mathbb{A} \quad (35)$$

$$\cos B = \frac{a^2 + \gamma - b^2}{2a\sqrt{\gamma}} = \frac{(a^2 + \gamma - b^2)\sqrt{\gamma}}{2a\gamma} \in \mathbb{A} \quad (36)$$

$$\cos C = \frac{a^2 + b^2 - (\sqrt{\gamma})^2}{2ab} = \frac{a^2 + b^2 - \gamma}{2ab} \in \mathbb{Q} \quad (37)$$

4.1 Triangle $(a, b, \sqrt{\gamma})$ diagonals

The only possible diagonals are for sides with integers, that is $\overline{a_m b_n}$. Using the law of cosines:

$$\overline{a_m b_n} = \sqrt{m^2 + n^2 - 2mn \cos C} \quad (38)$$

$$= \sqrt{m^2 + n^2 - 2mn \frac{a^2 + b^2 - \gamma}{2ab}} \quad (39)$$

$$= \frac{\sqrt{a^2 b^2 (m^2 + n^2) - acmn(a^2 + b^2 - \gamma)}}{ab} \in \mathbb{A} \quad (40)$$

where $1 \leq m < a$, $1 \leq n < b$ and $m \geq n$.

4.2 Example triangles($a, b, 2\sqrt{6}$)

In this case $\sqrt{\gamma} = 2\sqrt{6}$ so $\gamma = 24$. We form a matrix with the values $(a - b)^2$ satisfying the condition $a^2 \geq b^2 > \gamma$:

$$(a_m - b_n)^2 = \begin{matrix} & a=5 & a=6 & a=7 & a=8 & a=9 & a=10 & a=11 & a=12 & \dots \\ \begin{matrix} b=5 \\ b=6 \\ b=7 \\ b=8 \\ b=9 \\ b=10 \end{matrix} & \begin{pmatrix} 0 & 1 & 4 & 9 & 16 & 25 & 36 & 49 & \dots \\ & 0 & 1 & 4 & 9 & 16 & 25 & 36 & \dots \\ & & 0 & 1 & 4 & 9 & 16 & 25 & \dots \\ & & & 0 & 1 & 4 & 9 & 16 & \dots \\ & & & & 0 & 1 & 4 & 9 & \dots \\ & & & & & 0 & 1 & 4 & \dots \\ & & & & & & \vdots & \vdots & \ddots \end{pmatrix} \end{matrix} \quad (41)$$

We remove cells except those satisfying the condition $(a - b)^2 < \gamma$:

$$(a_m - b_n)^2 = \begin{matrix} & a=5 & a=6 & a=7 & a=8 & a=9 & a=10 & a=11 & a=12 & \dots \\ \begin{matrix} b=5 \\ b=6 \\ b=7 \\ b=8 \\ b=9 \\ b=10 \end{matrix} & \begin{pmatrix} 0 & 1 & 4 & 9 & 16 & \times & \times & \times & \dots \\ & 0 & 1 & 4 & 9 & 16 & \times & \times & \dots \\ & & 0 & 1 & 4 & 9 & 16 & \times & \dots \\ & & & 0 & 1 & 4 & 9 & 16 & \dots \\ & & & & 0 & 1 & 4 & 9 & \dots \\ & & & & & 0 & 1 & 4 & \dots \\ & & & & & & \vdots & \vdots & \ddots \end{pmatrix} \end{matrix} \quad (42)$$

Figure 6: Some triangles with sides $a \geq b > c = 2\sqrt{6}$

So we found that infinite triangles are valid, the smaller ones are:

$$(a, b, 2\sqrt{6}) = \begin{matrix} & \cos A & \cos B & \cos C \\ \begin{matrix} (5, 5, 2\sqrt{6}) \\ (6, 5, 2\sqrt{6}) \\ (6, 6, 2\sqrt{6}) \\ (7, 5, 2\sqrt{6}) \\ (7, 6, 2\sqrt{6}) \\ (7, 7, 2\sqrt{6}) \\ \dots \end{matrix} & \begin{pmatrix} \frac{\sqrt{6}}{5} & \frac{\sqrt{6}}{5} & \frac{13}{25} \\ \frac{13\sqrt{6}}{120} & \frac{35\sqrt{6}}{144} & \frac{37}{60} \\ \frac{\sqrt{6}}{6} & \frac{\sqrt{6}}{6} & \frac{2}{3} \\ 0 & \frac{2\sqrt{6}}{7} & \frac{5}{7} \\ \frac{11\sqrt{6}}{144} & \frac{37\sqrt{6}}{168} & \frac{61}{84} \\ \frac{\sqrt{6}}{7} & \frac{\sqrt{6}}{7} & \frac{37}{49} \\ \dots & \dots & \dots \end{pmatrix} \end{matrix} \quad (43)$$

Figure 6 show some triangles $(a, b, 2\sqrt{6})$. The cosines are calculated by code at:

github.com/heptagons/meccano/nest/t_test.go TestTslursC

5 Triangles pairs

We can attach two triangles to share a common side and vertex to get more angles and diagonals.

5.1 Triangles pairs rational cosines angles

When we sum two angles $Z = X + Y$, where $\cos X \equiv x_N/x_D$ and $\cos Y \equiv y_N/y_D$ we have:

$$\cos Z = \cos X \cos Y - \sin X \sin Y \quad (44)$$

$$= \frac{x_N}{x_D} \times \frac{y_N}{y_D} - \frac{\sqrt{x_S}}{x_D} \times \frac{\sqrt{y_S}}{y_D} \quad (45)$$

$$= \frac{x_N y_N - \sqrt{x_S y_S}}{x_D y_D} \quad (46)$$

5.1.1 Triangles pairs angles

Adding the angles of Triangles from $(1, 1, 1)$ to $(3, 3, 2)$ we get some sums. The values are calculated with code at:

github.com/heptagons/meccano/nest/t_test.go TestTCosAplusB

Pair	$vertex_X$	$vertex_Y$	$\cos(X + Y)$

25	(5,5,1)[C]	(4,4,3)[A]	$\frac{147-33\sqrt{5}}{400}$
26	(5,5,1)[C]	(4,4,3)[C]	$\frac{1127-99\sqrt{5}}{1600}$
Pair	$vertex_X$	$vertex_Y$	$\cos(X + Y)$

5.2 Triangles pairs diagonals

So we can calculate new diagonals from one triangle side to another triangle side:

$$\delta = \sqrt{m^2 + n^2 - 2mn \cos Z} \quad (47)$$

$$= \sqrt{m^2 + n^2 - 2mn \frac{b_1 + c_1 \sqrt{d_1}}{a_1}} \quad (48)$$

$$= \frac{\sqrt{a_1^2(m^2 + n^2) - 2mn(b_1 + c_1 \sqrt{d_1})}}{a_1} \quad (49)$$

$$= \frac{\sqrt{a_1^2(m^2 + n^2) - 2b_1mn - 2c_1mn\sqrt{d_1}}}{a_1} \equiv \frac{b_2 + c_2\sqrt{d_2} + e_2\sqrt{f_2}}{a_2} \quad (50)$$

5.3 Triangles pairs surds angles

When we sum two algebraic angles $W = U + V$ when $\cos U = \sqrt{u_n}/u_d$ and $\cos V = \sqrt{v_n}/v_d$ we have:

$$\cos W = \cos U \cos V - \sin U \sin V \quad (51)$$

$$= \cos U \cos V - \sqrt{1 - \cos^2 U} \sqrt{1 - \cos^2 V} \quad (52)$$

$$= \frac{\sqrt{u_n v_n}}{u_d v_d} - \sqrt{\frac{u_d^2 - u_n}{u_d^2}} \sqrt{\frac{v_d^2 - v_n}{v_d^2}} \quad (53)$$

$$= \frac{\sqrt{u_n v_n} - \sqrt{(u_d^2 - u_n)(v_d^2 - v_n)}}{u_d v_d} \quad (54)$$

6 Triangle triplets

We can attach three triangles to share a common vertex and two sides.

6.1 Triple angles $2A + D$ and $A + 2D$

Lets add three angles, two angles A from a pair of triangles (a, b, c) and one angle D from single triangle (d, e, f) . For triangle (a, b, c) and using $\cos A$ and $\sin A$ from equations 3 and 4 we have:

$$\cos(2A) = 2\cos^2 A - 1 = 2\frac{a_N^2}{a_D^2} - 1 = \frac{2a_N^2 - a_D^2}{a_D^2} \quad (55)$$

$$\sin(2A) = 2\sin A \cos A = \frac{2a_N \sqrt{a_D^2 - a_N^2}}{a_D^2} \quad (56)$$

As with equations 3 and 4 lets define cosines and sines of triangle (d, e, f) :

$$\begin{pmatrix} \cos & \sin \end{pmatrix} \begin{pmatrix} D \\ E \\ F \end{pmatrix} = \begin{pmatrix} \frac{d_N}{d_D} & \frac{\sqrt{d_D^2 - d_N^2}}{d_D} \\ \frac{e_N}{e_D} & \frac{\sqrt{e_D^2 - e_N^2}}{e_D} \\ \frac{f_N}{f_D} & \frac{\sqrt{f_D^2 - f_N^2}}{f_D} \end{pmatrix} \quad (57)$$

Using $\cos(2A)$, $\sin(2A)$, $\cos D$ and $\sin D$ we have:

$$\cos(2A + D) = \cos(2A) \cos D - \sin(2A) \sin D \quad (58)$$

$$= \frac{(2a_N^2 - a_D^2)d_N - 2a_N \sqrt{(a_D^2 - a_N^2)(d_D^2 - d_N^2)}}{a_D^2 d_D} \quad (59)$$

Table 4: Pair of triangles (X_{ABC}) and (Y_{ABC}) adding three angles in two different forms $(2X + Y)$ and $(X + 2Y)$.

6.2 Triple angles $Z = A + D + G$

$$\begin{aligned}\cos(A + D) &= \cos A \cos D - \sin A \sin D \\ &= \frac{a_n d_n - \sqrt{a_s d_s}}{a_d d_d}\end{aligned}\tag{60}$$

$$\begin{aligned}\sin(A + D) &= \sin A \cos D + \cos A \sin D \\ &= \frac{d_n \sqrt{a_s} + a_n \sqrt{d_s}}{a_d d_d}\end{aligned}\tag{61}$$

$$\begin{aligned}\cos(A + D + G) &= \cos(A + D) \cos G - \sin(A + D) \sin G \\ &= \frac{a_n d_n g_n - g_n \sqrt{a_s d_s}}{a_d d_d g_d} - \frac{d_n \sqrt{a_s g_s} + a_n \sqrt{d_s g_s}}{a_d d_d g_d} \\ &= \frac{a_n d_n g_n - g_n \sqrt{a_s d_s} - d_n \sqrt{a_s g_s} - a_n \sqrt{d_s g_s}}{a_d d_d g_d}\end{aligned}\tag{62}$$

Table 5: Pair of triangles (X_{ABC}) and (Y_{ABC}) adding three angles in two different forms ($2X + Y$) and ($X + 2Y$).

Pair	$X = A \vee B \vee C$	$Y = A \vee B \vee C$	$Z = A \vee B \vee C$	$\cos(X + Y + Z)$
